

§ 3.1

# PROJECTILE MOTION

Definition 3.1.1 Projectile motion can be treated as two rectilinear motions, one in the horizontal direction experiencing zero acceleration and the other in the vertical direction experiencing constant acceleration

## KINEMATIC EQUATIONS:

Consider the diagram below

We have  $a_x = 0$ , the velocity in the horizontal direction remains constant ( $v_x = v_{0x}$ ) and the position in the x direction can be determined by:

$$x = x_0 + v_{0x}(t) \quad \text{--- (1)}$$

why is  $a_x$  equal to zero (assuming movement through the air)?

Since the positive y-axis is directed upwards,  $a_y = -g$ . Application of the constant acceleration equation yields

$$v_y = v_{oy} - gt \quad \text{--- (2)}$$

$$y = y_0 + v_{oy}(t) - \frac{1}{2}gt^2 \quad \text{--- (3)}$$

$$v_y^2 = v_{oy}^2 - 2g(y - y_0) \quad \text{--- (4)}$$

$$s = \sqrt{x^2 + y^2} \quad \text{--- (5)}$$

$$\theta = \tan^{-1}(y/x) \quad \text{--- (6)}$$

$$v = \sqrt{v_x^2 + v_y^2} \quad \text{--- (7)}$$

$$\theta = \tan^{-1}\left(\frac{v_y}{v_x}\right) \quad \text{--- (8)}$$

### Time of Flight

While the flight of a projectile, we need to solve for the time of flight of a projectile that is both launched and impacts on a flat horizontal surface by ~~performing~~ using the kinematic equations. i.e.

$$y - y_0 = v_{oy}t + \frac{1}{2}gt^2 \quad \text{--- (9)}$$

Solving for  $t$ , we have

$$T = \frac{2v_0 \sin \theta}{g} \quad \text{--- (10)}$$

Note that

$$v_x = v_0 \cos \theta$$

$$v_y = v_0 \sin \theta$$

$$x = (v_0 \cos \theta)t$$

$$y = (v_0 \sin \theta)t$$

Maximum height : the maximum height of trajectory of a projectile can be found from the kinematic equations. i.e

$$v^2 = v_0^2 + 2gx$$

→ that if  $v_y = 0$ , then

$$0 = v_0^2 + 2gx$$

then

$$H = \frac{v^2 \sin^2 \theta}{2g}$$

(11)

Range : from the trajectory equation, we can also find the range, or the horizontal distance travelled by the projectile.

i.e

$$x - x_0 = v_0 t + \frac{1}{2}gt^2$$

the position  $y$  is zero for both the launch point and the impact point. Since we are considering only a flat horizontal surface.

Setting  $y = 0$ , then  $x = 0$ , so that

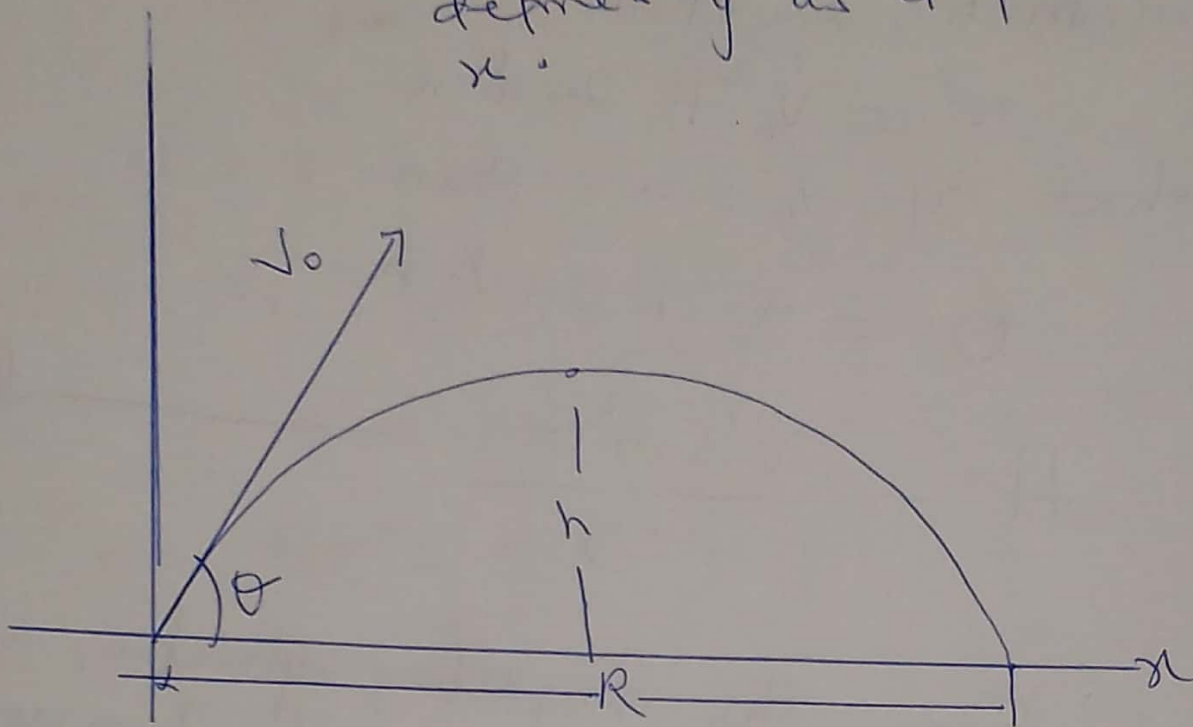

$$x - x_0 = v_0 t$$

Using the identity  $2\sin\theta\cos\theta = \sin 2\theta$  such that  $x = R$ , then

$$R = \frac{v_0 \sin 2\theta}{g}$$

(12)

Example 3.2 Given  $V_0$  and  $\theta$  from the diagram below: Find the equation that defines  $y$  as a function of  $x$ .

Solution: Along  $V_x = V_0 \cos \theta$  and  $V_y = V_0 \sin \theta$   
we have  $x = (V_0 \cos \theta)t$ . or  $t = \frac{x}{V_0 \cos \theta}$

$$y = (V_0 \sin \theta)t - \frac{1}{2}g(t)^2$$

Substituting for  $t$ :

$$y = (V_0 \sin \theta) \left( \frac{x}{V_0 \cos \theta} \right) - \frac{g}{2} \left( \frac{x}{V_0 \cos \theta} \right)^2$$

By simplification,

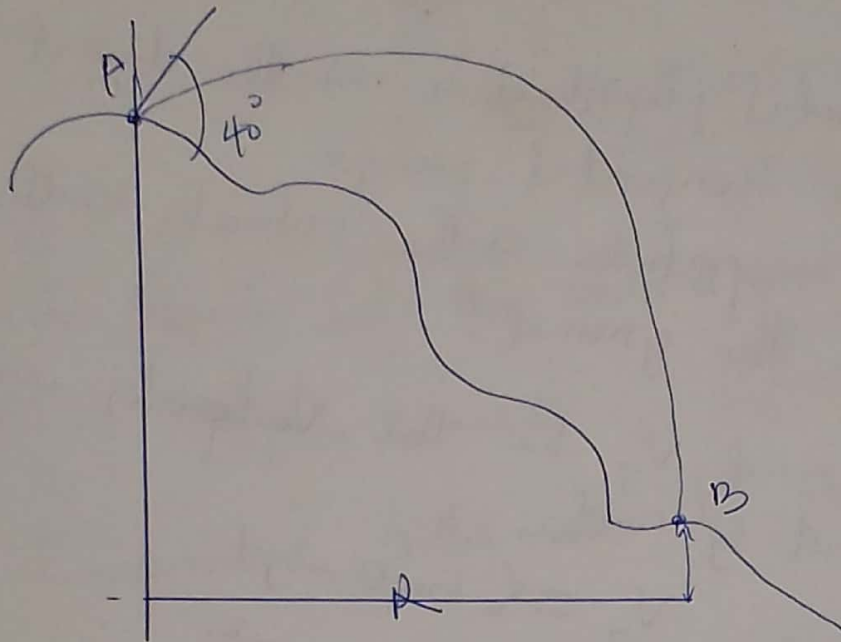

$$y = x \tan \theta - \left( \frac{g x^2}{2 V_0^2} \right) (1 + \tan^2 \theta)$$

(13)

The above equation (13) is called the "path equation" which describes the path of a particle in projectile motion.

Example 3.3 The below diagram shows a snowmobile going 15 m/s at point A. Find the horizontal distance ~~the~~ travels and the time in the air.

Solution from the equation for the horizontal motion

$$x_B = x_A + v_{Ax} t_{AB}, \quad v_{Ax} = v_{0x} \cos \theta \text{ m/s}$$

$$\text{Horizontal motion} = 15 \cos 40^\circ \quad \text{--- (1)}$$

Vertical motion equation:  $y_B = y_A + v_{Ay} t_{AB} - \frac{1}{2} g t_{AB}^2$  (3)

$$v_{Ay} = 15 \sin 40^\circ \text{ m/s} \quad \text{--- (2)}$$

Note that  $x_B = R, \quad x_A = 0, \quad y_B = (-3/4)R$ . (4)

and  $y_A = 0$ . Solving (3) & (4), we have

$$R = 42.8 \text{ m} \quad \text{and} \quad t_{AB} = 3.72 \text{ s}$$

Example 3.4 An object is launched at a velocity of  $20 \text{ m/s}$  in a direction making an angle of  $25^\circ$  upwards with the horizontal.

- (i) What is the maximum height reached by the object?  
 (ii) What is the total flight time of the object?  
 (iii) What is the horizontal range?  
 (iv) What is the magnitude of the velocity of the object just before it hits the ground?

Sol Let  $V_x$  and  $V_y$  be the ~~velocities~~ <sup>components</sup> with respect to  $x$  and  $y$ . then

$$V_x = V_0 \cos \theta, \quad V_y = V_0 \sin \theta - gt.$$

$$V_0 = 20 \text{ m/s}, \quad \theta = 25^\circ, \quad g = 9.8 \text{ m/s}^2.$$

Let that  $V_y = V_0 \sin \theta - gt = 0$ .

$$t = \frac{V_0 \sin \theta}{g} = \frac{20 \sin 25^\circ}{9.8} = 0.86 \text{ sec}$$

To find the maximum height.

$$s = V \sin \theta t - \frac{1}{2} gt^2$$

$$= 20 \sin 25^\circ (0.86) - \frac{1}{2} (9.8) (0.86)^2 = 3.64 \text{ m}$$

(ii) At  $t = t_1$  and  $t = t_2$ ,  $y = 0$ . Hence

$$V_0 \sin \theta t - \frac{1}{2} gt^2 = 0$$

$$t = t_1 = 0 \quad \text{and} \quad t = t_2 = \frac{2 V_0 \sin \theta}{g}$$

$$\begin{aligned} \text{Time of flight} &= t_2 - t_1 = \frac{2(20) \sin \theta}{g} \\ &= \frac{2 \times 20 \sin 25^\circ}{9.8} = 1.72 \text{ sec} \end{aligned}$$

(iii) the horizontal Range is

$$R = \frac{2V_0 \cos \theta \sin \theta}{g} = \frac{V_0^2 \sin 2\theta}{g}$$

$$= \frac{20^2 \times \sin 2(25^\circ)}{9.8} = \underline{\underline{31.26m}}$$

(iv) the object hits the ground at  $t = t_2 = \frac{2V_0 \sin \theta}{g}$ .

So that  $V_x = V_0 \cos \theta$ ,  $V_y = V_0 \sin \theta - gt$ .

the component of the velocity at  $t = \frac{2V_0 \sin \theta}{g}$

are

$$V_x = V_0 \cos \theta = 20 \cos 25^\circ$$

$$V_y = V_0 \sin 25^\circ - g \left( \frac{2 \cdot V_0 \sin 25^\circ}{g} \right) = -V_0 \sin 25^\circ$$

the magnitude  $V$  of the velocity is given by

$$V = \sqrt{V_x^2 + V_y^2} = \sqrt{(20 \cos 25^\circ)^2 + (-20 \sin 25^\circ)^2}$$

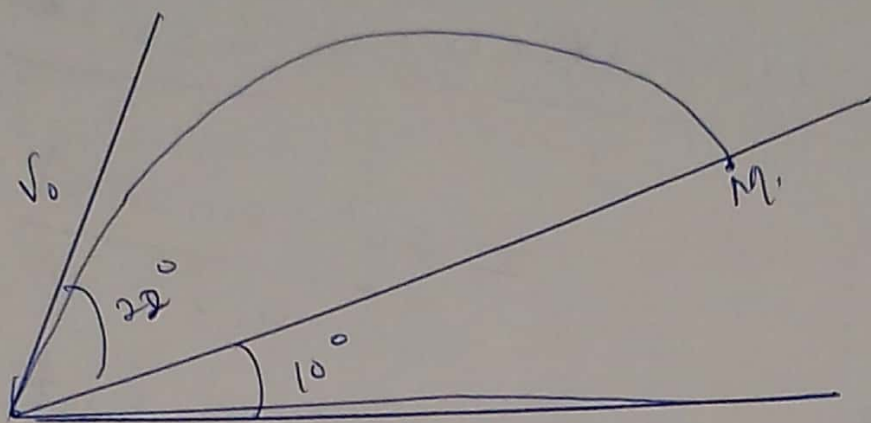

$$= V_0 = 20 \text{ m/s}$$

Example 3-5 A projectile is launched from the point O at angle of  $22^\circ$  with an initial velocity of  $15 \text{ m/s}$  up an inclined plane that makes an angle of  $10^\circ$  with the horizontal. the projectile hits the incline plane at point M.

(i) Find the time it takes for the projectile to hit the incline plane

(ii) Find the distance OM.

Soln

The x and y component of the displacement are given by

$$x = V_0 \cos \theta t \quad y = V_0 \sin \theta t - \frac{1}{2} g t^2 \quad (1)$$

with  $\theta = 22^\circ + 10^\circ = 32^\circ$ ,  $V_0 = 15 \text{ m/s}$

the relationship between the coordinate x and y on the incline is given by

$$\tan 10^\circ = \frac{y}{x} \quad (2)$$

Substitute x and y by the expression into (2)

$$\tan 10^\circ = \frac{(V_0 \sin \theta - \frac{1}{2} g t^2)}{V_0 \cos \theta t}$$

By simplification to obtain t.

$$\frac{1}{2} g t + V_0 \cos \theta \tan 10^\circ - V_0 \sin \theta = 0$$

Solve for t.

$$t = \frac{V_0 \sin \theta - V_0 \cos \theta \tan 10^\circ}{(0.5) g} = \frac{15 \sin 32^\circ - 15 \cos 32^\circ \tan 10^\circ}{0.5 \times 9.8} = 1.16 \text{ s}$$

$$(11) \quad 6M = \sqrt{(v_0 \cos \theta t)^2 + (v_0 \sin \theta t - \frac{1}{2} g t^2)^2}$$

$$at \quad t = 1.16$$

$$6M = \sqrt{15 \cos 32 (1.16)^2 + (15 \sin 32 (1.16) - \frac{1}{2} 9.8 (1.16)^2)^2}$$

$$= \underline{\underline{15m}}$$

Example 3.6 Two balls A and B of masses 100 grams and 300 grams respectively are pushed horizontally from a table of height 3 metres. Ball A is pushed so that its initial velocity is 10 m/s and ball B is pushed so that its initial velocity is 15 m/s. Find (i) the time it takes each ball to hit the ground.

(ii) What is the difference in the distance between the points of impact of the two balls on the ground?

Sol The two balls are subject to the same gravitational acceleration and therefore will hit the ground at the same time  $t$ .

By equation  $-3 = -\frac{1}{2} g t^2$

$$t = \sqrt{\frac{3(2)}{9.8}} = 0.785$$

(i) Horizontal distance  $X_A$  of ball A

$$X_A = 10 \text{ m/s} \cdot 0.785 = 7.8 \text{ m}$$

$$X_B = 15 \text{ m/s} \times 0.78 \text{ s} = 11.7 \text{ m}$$

Difference in distance  $X_A$  &  $X_B$

$$|X_B - X_A| = |11.7 - 7.8| = \underline{\underline{3.9 \text{ m}}}$$
